GWF Acquires Assets of i20 Water Ltd. to Provide End-to-End Smart Water Network Offering

GWF AG, the Swiss utility metering and smart water technology company, today announced the acquisition of the Assets of i20 Water Ltd., a UK-based specialist in water network pressure optimization and leakage reduction.

i20 is an established provider of pressure management technology to water utilities across the United Kingdom and selected international markets, with a product suite spanning data loggers, advanced pressure-reducing valve (PRV) controllers, and adaptive optimization software. Its solutions are deployed to help utilities reduce Non-Revenue-Water, lower burst frequency, extend asset life, and cut the energy and carbon associated with over-pressurized networks.

The acquisition unites two complementary technologies into a single, integrated offering. GWF BALANCE, the company's pressure-optimization solution, predicts the optimal zone pressure across a distribution network. i20's PRV controller and Adaptive Open Loop technology then execute that target autonomously at the valve – closing the loop from advisory insight to near real-time intervention.

«I am truly excited to welcome i20 Water into GWF,» said Florian Strasser, CEO & Chairman of GWF AG. «Water utilities everywhere face challenges in water network management, often with constrained budgets. By bringing together i20's proven pressure-management technology with GWF BALANCE and our broader INFINIO® data platform, we can offer customers a system that not only tells you what optimal looks like but also delivers it. This innovative and cost-effective solution helps our water utility customers to reach the next level in network management and Non-Revenue-Water reduction.»

Existing i20 customers and partners can expect continuity of service and support throughout the transition, alongside the expanded engineering resources, platform capabilities, and long-term investment that GWF brings to the business. The existing team will be integrated into GWF's UK business unit. The production of i20 products will remain in Southampton.

«We look forward to working closely with i20's customers and partners as we continue to advance smarter, more efficient, and more sustainable water networks in our key markets,» said Gary Vincent, Managing Director of GWF Ltd.

About GWF AG

GWF AG, headquartered in Lucerne, Switzerland, is an internationally active family-owned company with more than 125 years of experience in the development and production of metering systems for water, gas, heat, and electricity. GWF offers innovative system solutions for the collection, communication, and analysis of consumption data. Through its own technologies and strategic partnerships, GWF develops scalable and sustainable solutions that support energy utilities, industrial companies, property managers, and operators of critical infrastructure in successfully meeting the challenges of the water and energy transition.

About i2O Water Ltd

i2O Water Ltd., headquartered in Southampton, United Kingdom, is an internationally active provider of intelligent water network solutions. The company supports water utilities worldwide with technologies that instrument, analyse, and control water networks to reduce leakage, lower energy consumption, and improve supply reliability. Through advanced pressure management, network analytics, event management, data logging, and robust field devices, i2O develops scalable solutions that help utilities address the challenges of climate change, ageing infrastructure, population growth, and sustainable water supply. i2O's solutions are used by more than 100 water utilities in over 45 countries, serving more than 50 million people.
